Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1-12. (Cancelled)
- 13. (Currently Amended) A method of controlling a gap between at least one fixed plate and an electrostatically movable plate in a MEMs device, comprising:

time modulating a control signal to a controlled current output that is variable voltage compliant to represent a desired gap between the fixed plate and the electrostatically movable plate;

selectively routing a charge which is a function of the controlled current output and the modulated time to array elements each including control circuitry and one of [[the]] a plurality of electro-mechanical devices; and

displacing the electrostatically movable plate in response to the controlled current output.

- 14. (Previously Presented) The method as defined in claim 13, wherein selectively routing a charge comprises selectively mirroring a reference current onto the controlled current output coupled to the MEMs device on the basis of the time modulated control signal.
- 15. (Previously Presented) The method of claim 14, wherein selectively mirroring the reference current selectively mirrors the reference current onto a plurality of controlled current outputs, each of the plurality of controlled current outputs being coupled to one of a plurality of MEMs devices, and

wherein displacing the electrostatically movable plate displaces an electrostatically movable plate in each of the plurality of MEMs devices in response to a corresponding controlled current output.

- 16. (Previously Presented) The method of claim 14, further comprising: generating the reference current.
- 17. (Original) The method of claim 16, further comprising:

adjusting the reference current to represent the desired gap between the fixed plate and the electrostatically movable plate.

- 18. (Previously Presented) The method of claim 14, wherein selectively mirroring the reference current onto the controlled current output generates the variable voltage compliant controlled current output.
- 19. (Original) The method of claim 13, further comprising selectively setting a predetermined charge in the MEMs device before displacing the electrostatically movable plate in response to the controlled current output.

20-33. (Cancelled)

34. (Previously Presented) An apparatus for controlling a gap between at least one fixed plate and an electrostatically movable plate in a MEMs device, comprising:

means for selectively setting a reference current onto a controlled current output that is variable voltage compliant, the controlled current output coupled to the MEMs device on the basis of the time modulated control signal;

means for time modulating a control signal to represent a desired gap between the fixed plate and the electrostatically movable plate by a charge which is a function of the controlled current output and the modulated time; and

means for displacing the electrostatically movable plate in response to the controlled current output.
